The membrane-bound proteins and receptor molecules are useful as pharmaceutical and diagnostic agents. Receptor immunoadhesins, for instance, can be used as therapeutic agents to block receptor-ligand interactions. The membrane-bound proteins can also be employed for screening of potential peptide or small molecule inhibitors of the relevant receptor/ligand interaction. The PRO encoding sequences are useful as hybridization probes, in chromosome and gene mapping and in the generation of antisense RNA and DNA. PRO nucleic acid sequences will also be useful for the preparation of PRO polypeptides, especially by

                                                                                   The present invention describes an isolated polypeptide comprising an immunogenic portion of an ovarian carcinoma protein (or its variants). Ovarian carcinoma proteins, and polynucleotides encoding them, have cytostatic activity and can be used in gene therapy and vaccines. Ovarian carcinoma polypeptides, nucleic acids, antibodies and vaccines are useful for the prevention, diagnosis and treatment of cancer, preferably ovarian cancer. AAA69691 to AAA70077 and AAB12552 to AAB12557 represent human ovarian carcinoma polynucleotides and proteins used in the exemplification of the present invention
                                                                                                                                                                                                                                                                                                      Immunogenic portion of an ovarian carcinoma protein and the nucleic encoding it, useful for the diagnosis, prevention and treatment of cancer, preferably ovarian cancer.

Novel nucleic acids encoding PRO polypeptides, used to opresence of tumors, such as prostate and breast tumors, screen for modulators of the compounds. diagnose the and ťο

Claim 11; Fig 218; 774pp; English.

Sequences AAU29024-AAU29328 represent PRO polypeptides of the invention. The PRO polypeptides and their associated nucleic acids can be used to detect the presence of a tumour in a manmal by comparing the level of expression of a PRO polypeptide in a test sample of cells from the animal and a control sample of normal cells, whereby a higher level of expression in the test sample indicates the presence of a tumour in the mammal. Mammals include dogs, cats, cattle, horses, sheep, pigs, goats and rabbits but are preferably human. The polypeptides can be used to stimulate tumour necrosis factor (TNF) alpha release from human blood, when contacted with it. A specific polypeptide can be used to stimulate the proliferation or differentiation of chondrocyte cells. The PRO proteins can be used to determine the presence of tumours and also susceptibility to tumour development, particularly adrenal, lung, colon, breact in mammalian breast, prostate, rectal, cervical, or liver tumours, in mammalian subjects. The oligonucleotide probes specific for the PRO nucleic a can be used for genetic analysis of individuals with genetic disord disorders acids

Sequence 282 AA.

Eighty four nucleic acids encoding PRO polypeptides, useful in mol biology, including use as hybridization probes, and in chromosome gene mapping.

Immunogenic portion of an ovarian carcinoma protein and the nucleic encoding it, useful for the diagnosis, prevention and treatment of cancer, preferably ovarian cancer. acid

Example 2; Page 205-206; 299pp; English.

The present invention describes an isolated polypeptide comprising an immunogenic portion of an ovarian carcinoma protein (or its variants). Ovarian carcinoma proteins, and polypucleotides encoding them, have cytostatic activity and can be used in gene therapy and vaccines. Ovarian carcinoma polypeptides, nucleic acids, antibodies and vaccines are useful for the prevention, diagnosis and treatment of cancer, preferably ovarian cancer. AAA99691 to AAA70077 and AAB12552 to AAB12557 represent human ovarian carcinoma polynucleotides and proteins used in the exemplification of the present invention

The polypeptides, polynucleotides, antibodies, fusion proteins, T cell populations and antigen presenting cells that express the polypeptides are useful for stimulating an immune response in a patient and treating ovarian cancer. This sequence represents protein

                                                                                                                                                                                                                                                                                                                                                                            The invention relates to an isolated O772P polypeptide, which has the structure fully defined in the specification. The composition containing the polypeptides, polynucleotides, fusion proteins, antibodies, T-cells or antigen presenting cells are useful for stimulating an immune response and treating ovarian cancer. Detecting the presence of the polynucleotides and polypeptides is useful for diagnosing cancer. Ovarian carcinoma cDNAs and protein cDNAs were identified using microarray technology. The present sequence represents a human ovarian carcinoma
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                         Mitcham Reed SG,

                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                    The present sequence is a human PRO polypeptide (secreted and transmembrane). The PRO protein, and PRO agonists, PRO antagonists or anti-PRO antibodies are useful if or preparation of a medicament useful it the treatment of a condition which is responsive to the PRO protein, agonists, antagonists or anti-PRO antibodies. The PRO protein may also employed as molecular weight markers for protein electrophoresis. The Pcoding sequence has applications in molecular biology, including use as hybridisation probes, and in chromosome and gene mapping
                                                                                                                                                             29-NOV-2000;

                                                                                                                                                                                                                                                                                                                                                                                      The present invention relates to human breast tumour protein coding sequences (see AAH55479-AAH55513, AAH55517-AAH55679 and AAH55682-AAH55762). The breast tumour protein DNA sequences may be used in the prevention, diagnosis and treatment of diseases associated with inappropriate expression of the breast tumour protein e.g. breast cancer the present sequence is a human ovarian tumour-derived antigen, which

                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                proteins. The PRO proteins have cytostatic activity. The PRO proteins can be used for targeted delivery of bioactive molecules, such as toxins, radiolabels or antibodies, that cause cell death. PRO nucleotide sequences, and their fragments, can be used as hybridisation probes, in chromosomal and gene mapping, and in the generation of anti-sense RNA and DNA. They may also be used to produce transgenic animals which are used to develop and screen therapeutically useful reagents. The PRO nucleotide and protein sequence can be used for tissue typing and in treating cancer. Anti-PRO antibodies can be used in diagnostic assays. AAF44270 to AAF44470 represent PCR primers and hybridisation probes used in the isolation of human PRO sequences. AAF44087 to AAF44269 and AAB65154 to AAB65300 represent human PRO polynucleotide and protein sequences given in the exemplification of the present invention
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                       24-FEB-2000;

RESULT 11

The present invention relates to novel human B7-like polypeptides and CC polynucleotides encoding such proteins. Sequences of the invention are used for preventing, treating or ameliorating a medical condition in a manual lan subject. The polynucleotides and polypeptides are administered to subjects having a disorder related to B-7 Like polypeptides, such as CC inappropriate or excessive inflammation which can lead to tissue damage or even death, where the inflammation is brought about by the activation of certain cells in the body e.g. T cells and may involve disorders CC related to immune system. The nucleic acids, proteins, antibodies, agonists and antagonists of the invention are useful in the diagnosis, CC treatment and prevention of cancer (e.g. cancers of the adrenal gland, CC bone, bone marrow, breast, gastrointestinal tract, liver, urogenital or lammon, bone marrow, breast, gastrointestinal tract, liver, urogenital or CC disease, multiple sclerosis, rheumatoid arthritis, ulcerative colitis), CC disease, multiple sclerosis, rheumatoid arthritis, ulcerative colitis), CC cardiovascular disorders (e.g., myocardial ischaemlas), nervous system CC (e.g., cryptorchism, Paget's disease), gastrointestinal disorders (e.g., diabetes mellitus, Grave's disease), reproductive system disorders (e.g., cryptorchism, Paget's disease), gastrointestinal disorders (e.g., hepatitis, hepatitis, bacterial, fungal and epilepsy) and infectious diseases such as viral, bacterial, fungal and parasitic WPI; 200 N-PSDB; Addison's disease; autoimmune haemolytic anaemia; autoimmune thyroiditis; diabetes mellitus; Crohn's disease; multiple sclerosis; allergy; cancer; rheumatoid arthritis; cardiovascular disorder; nervous system disorder; myocardial ischaemia; ulcerative colitis; reproductive system disorder; Alzheimer's disease; Parkinson's disease; endocrine disorder; hepatitis; Isolated nucleic acids encoding human B7-like polypeptides, useful diagnosis and treatment of e.g. inflammation, cancer, immune disord such as Addison's disease, and cardiovascular disorders such as diabetes mellitus; Grave's disease; Paget's disease; liver disorder; gastrointestinal disorder; irritable bowel syndrome; cerebral anoxia; dysphagia; hepatomegaly; neurological disease; infectious disease; epilepsy; gene therapy; B7-H8 protein; chromosome 1. myocardial ischemias. 30-JUN-2000; 2000US-0215135P 14-AUG-2000; 2000US-0225266P Key Example 1; Fig 1; 493pp; English. Assessing whether a patient is afflicted with ovarian cancer, useful in assessing the stage or progression of the disease, comprises comparing the expression level of a cancer marker in a sample from a patient and ы cancer patient.

Disclosure; Page 468-469; 481pp; English

the expression level of a marker in a patient sample and the normal level of expression of the marker in a control non-ovarian cancer sample, where the marker is selected from 363 cancer markers described in the specification. The method of the invention is useful in diagnosing or characterising cancer, in detecting the presence of cancer as early as particular use with patients having an enhanced risk of developing convarian cancer (e.g. patients having an familial history of ovarian cancer). The cancer markers may be used in the management and treatment of e.g. brain and central nervous system disorders (e.g. bacterial and control nervous system disorders (e.g. bacterial and confidence (e.g. bacterial of e.g. bacterial or viral meningitis or encephalitis), connective tissue disorders (e.g. nontuberculous granulomatous orchitis), connective tissue disorders, or heart disorders (e.g. ischaemic heart consective tissue disorders), or heart disorders (e.g. ischaemic heart consecting a composition the progression of ovarian cancer, determining whether ovarian cancer has metastasized or is likely to metastasize, sequence or at risk of developing ovarian cancer. The present amino acid convertion is one of the ovarian cancer markers described in the convertion cancer or at risk of developing ovarian cancer markers described in the convertion. patient is afflicted with ovarian cancer. The method invention relates to a new method for assessing involves comparing whether

```
The invention describes an isolated antibody which binds to a tumour-associated antigenic target (TAT) polypeptide. The antibody is useful for: killing a cancer cell (such as a breast, colorectal, lung, ovarian, central nervous system, liver, bladder, pancreatic, cervical, melanoma or leukaemia cell) that expresses a polypeptide with at least 80% identity to the TAT polypeptide sequence; treating a tumour comprising cells that express a polypeptide with at least 80% identity to the TAT polypeptide eith at least 80% identity to the TAT polypeptide sequence; determining the presence of a polypeptide having at least 80% identity to the TAT polypeptide; diagnosing the presence of a tumour in a mammal, and for antibody dependent enzyme mediated prodrug therapy
                                                                                                                                                                                                                                                                                                                             Novel isolated antibody which binds to tumor-associated antigenic target polypeptide useful for killing cancer cells expressing the polypeptide and for treating tumor comprising cells that expresses the polypeptide.
                                                                                                                                                                                                                                                                                                                                                                                                                           WPI; 2002-280928/32.

CC ABG95851-ABG95934 or their associated signal peptide, or a sequence of an extracellular domain of the proteins with their associated signal peptide CC acids encoding the proteins, vectors, host cells, fusion proteins are cardiaged encoding the proteins, vectors, host cells, fusion proteins are considered sendoding the proteins, vectors, host cells, fusion proteins are considered in the specifically bind to the proteins. The proteins are considered in the second peptide designated as E, F, G, H or I (or vice versa) and determining the formation of a N,E, B/F, B/G, C/H or D/I polypeptide conjugate in the sample, where the formation of the conjugate is conjugate in the sample, where the formation of polypeptide, C is a prolloge polypeptide, D is a prolloge polypeptide, C is a prolloge polypeptide, D is a prolloge polypeptide, C is a prolloge polypeptide, D is a prolloge polypeptide, H is a cell suspected of expressing the A, B, C or D polypeptide. H is a cell suspected of expressing the A, B, C or D polypeptide. The sample comprises a cell expressing a polypeptide with a detectable label or is attached to a cell expressing a polypeptide designated as A, B, C or D or E, F, G, C T and the proteins are useful for linking a bioactive molecule is a toxin, a radiolabel or an antibody.

CC The bioactive molecule causes death of the cell. A, B, C or D or E, F, G, H, or I The cell is killed. The proteins are useful for modulating a biological activity of a cell expressing a polypeptide designated as A, B, C or D or E, F, G, H, or I The cell is killed. The proteins are useful for modulating a biological continuity of a cell expressing a polypeptide designated as A, B, C or D or E, F, G, H, or I The cell is killed. The proteins are useful for the treatment of a condition which is responsive to the

Nucleic acids encoding the proteins are useful as hybridisation probes, in chromosome and gene mapping, in the generation of anti-sense RNA and DNA, for the preparation of the proteins, to generate transgenic or knockout animals which are useful in the development and screening of therapeutic useful reagents, for chromosome identification, and in gene therapy. The antibody is useful as a therapeutic agent, in a diagnostic assay and for affinity purification of the protein from recombinant cell culture natural sources. The present represents a novel secreted or transmembrane protein of the

Tumour-associated antigenic target protein,

TAT136.

05-JUN-2002

(first entry)

```
The invention relates to an isolated tumour-associated antigenic target polypeptide (TAT) (I), specifically TATI34-TATI38 polypeptides, and the polypucleotides (II) encoding them. (II) is useful for diagnosing the presence of a tumour in a mammal, where the level of expression of (II) is indicative on the presence of tumour in the mammal from which the test sample was obtained. Antibody to (I) is useful for killing a cancer cell, (e.g. breast cancer cell, a colorectal cancer cell, a lung cancer cell, an ovarian cancer cell, a central nervous system (CNS) cancer cell, a liver cancer cell, a bladder cancer cell, a pancreatic cancer cell, a
                                                                                                                                                                                                                                                  24-AUG-2000; 2000WO-US023328.

                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                            cc hybridising to (II) are useful as diagnostic probes, antisense cc hybridising to (II) are useful as diagnostic probes, antisense cc digonucleotide probes or for encoding fragments of full length TAT cc polypeptide. (II) is also useful in chromosome and gene mapping and in ct the generation of antisense RNA and DNA probes, for constructing cc hybridisation probes for mapping the gene encoding TAT and for genetic canalysis of individuals with genetic disorders. (II) is also useful for cgenerating either transgenic animals or knockout animals, and in gene ct therapy. The TAT polypeptides and nucleic acids may also be used for tissue typing and the TAT polypeptides are useful for screening compounds that mimic the TAT polypeptide (agonist) or prevent the effect of TAT polypeptide (antagonist). The antibody is useful for staging TAT cc polypeptide (antagonist). The antibody is useful for staging TAT cc polypeptide from cells, for detection and quantitation of TAT polypeptide in vitro, e.g., in an enzyme linked immunosorbent assay (ELISA) or expressing cancer or alleviating one or more symptoms of cancer in a cc amamal. The present sequence represents the amino acid sequence of TAT136 cx
